JOB MARKET PAPER	<p>Siravegna, M., “The Gender Gap across the Wage Distribution in Chile: An Application of Copula-Based Methods”, 2020.</p> <p><i>In this paper, I analyze the gender pay gap across the wage distribution in Chile. I use quantile regression technique and correct for sample selection using a copula-based methodology. My results highlight the importance of heterogeneous effects and selective participation in gender gaps. If men’s and women’s rates of employment were equal, the gap would be approximately 30 percentage points in all quantiles. My analysis reveals that the gender wage gap oscillates between 25 and 35 log points at the bottom half of the hourly wage distribution but increases to approximately 50 log points in the upper quantiles, evidencing a “glass ceiling” effect. Finally, I decompose the gender pay gap into “structural” and “composition” effects, concluding that the gap is explained mainly by differences in rewards for observable labor market characteristics and not by differences in the distribution of those characteristics.</i></p>
